

[illegible][illegible]

$\lambda_{\text{eff}} \approx 5,4 \mu\text{m}$
 $n \approx 1,7$
 Gelöst:
 $\lambda = 5,4 \mu\text{m}$ | Temperatur:
 $n_{\text{eff}} = \frac{n_0}{n_0 - \frac{1}{1000}} = \frac{1,772}{1,772 - 0,001} \approx 1,772 \cdot 10^{-3} \mu\text{m}$
 $\frac{\lambda_{\text{eff}}}{\lambda} = ?$ | $V_{\text{eff}} = \sqrt{\frac{2kT}{m_{\text{eff}}}}$ | $V_{\text{eff}} = \sqrt{\frac{2kT}{m_0}} \Rightarrow$
 $\Rightarrow \frac{V_{\text{eff}}}{V_{\text{eff}}} = \sqrt{\frac{2kT}{m_0}} = \sqrt{\frac{2kT}{m_0}} = \sqrt{\frac{2kT}{m_0}} =$
 $= \sqrt{\frac{1,772}{1,772 - 0,001}} \approx 1,772 \cdot 10^{-3}$
 in Einheit 8 $1,772 \cdot 10^{-3} \mu\text{m}$.
 Dimension: μm
 Lösung:
 Temperatur: $T_0 = \frac{h\nu}{k} =$
